## **AG FR series**

## standard brackish water RO elements

The A-Series family of proprietary thin-film reverse osmosis membrane is characterized by high flux and relatively high sodium chloride rejection. AG FR brackish water elements are selected when durability and cleaning effectiveness are important.

The AG FR membrane element is specifically designed with a larger feed spacer to enhance feed flow channels, maximizing the element energy & cleaning efficiencies at the same time. This feature improves the membrane element durability over the time, by promoting effective CIPs, reducing cleaning intervals and need for harsher chemicals.
